blocking the volatage-dependent anion channel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane. The Bcl-x(S) and Bcl-x(beta) isoforms promote access.
                                               FUNCTION: Potent inhibitor of cell death. Inhibits caspases (By similarity). Appears to regulate cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RGGW

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TISSUE SPECIFICALLY EXPRESSED IN CEREBELLUM, HEART, AND THYMUS. IN THE SPECIFICALLY EXPRESSED IN CEREBELLUM, HEART, AND THYMUS. IN THE OVARY, THE PREDOMINARY FORM IS BCL-X(L), WITH A SMALL BUT DETECTABLE LEVEL OF BCL-X(S).

DOMAIN: The BH4 domain is required for anti-apoptotic activity. DOMAIN: The BH4 domains are required for both heterodimerization with other Bcl2 family members and for repression of cell death.

The BH4 and BH2 domains are required for both heterodimerization with other Bcl2 family members and for repression of cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ALTERNATIVE PRODUCTS: 3 ISOFORMS; BCL-X(L) (SHOWN HERE), BOAND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING.

                                                                                                                                                                                                                                                                                                                                                                                                     "Quantification of control of the regular term hibernating myocardium.";

J. Mol. Cell. Cardiol. 31:147-158(1999).

-!- FUNCTION: Potent inhibitor of cell death. Inhibits activation conspases (By similarity). Appears to regulate cell death by blocking the voltage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane.

-!- SUBUNIT: Bcl-x(L) forms heterodimers with BAX, BAK and Bcl-2 (similarity). Heterodimerization with BAX does not seem to be required for anti-apoptotic activity (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CONFLICT

```
AND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING.

1. TISSUE SPECIFICITY: BCL-X(S) IS EXPRESSED AT HIGH LEVELS IN CELLS THAT UNDERGO A HIGH RATE OF TURNOVER, SUCH AS DEVELOPING LYMCHOCYTES. IN CONTRAST, BCL-X(L) IS FOUND IN TISSUES CONTAINING LONG-LIVED POSTMITOTIC CELLS, SUCH AS ADULT BRAIN.

1. DOMAIN: The BH4 domain is required for anti-apoptotic activity. The BH1 and BH2 domain are required for both heterodimerization with other Bcl2 family members and for repression of cell death. PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptosic activity.

1. SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.

1. SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.

1. SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                                                                         modified and this statement is not removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "Modulation of cell death bx Bcl-xL through caspase interaction.";
Proc. Natl. Acad. Sci. U.S.A. 95:554-559(1998).
-:- FUNCTION: Potent inhibitor of cell death. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane. The Bcl-x(S)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sattler M., Liang H., Nettesheim D., Meadows R.P., Har

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                               114

The Bok protein and transgenic animal are also useful for identifying ligands c substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok
                                                                                                                                                                                                                                                                       Bok protein; Bcl-2-related ovarian killer; BH31 variant; endometriosis; pro-apoptotic protein; apoptosis inducer; hyperproliferation disease; reproductive tissue; uterine carcinoma; testicular carcinoma; cervix; ovarian carcinoma; glandular epithelial carcinoma; cancer; therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimentisation properties
                                                                                                                                                            Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 1999-327356/27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence is a mammalian Bok (Bcl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                      pro-apoptotic protein; apoptosis inducer; hyperproliferation disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence is a mammalian Bok (BCl-2-related ovarian killer)
CC protein, of the invention. Coding sequences for Bok or BH3i variants of
CC protein control bok-related protein can be introduced into cell populations
CC to upregulate expression of the proteins in order to induce apoptosis in
CC the cell population. This is useful for treatment of diseases where there
CC is hyperproliferation of reproductive tissue, e.g. uterine, testicular
CC and ovarian carcinomas, endometriosis, squamous and glandular epithelial
CC carcinomas of the cervix. Cell killing induced by Bok can be suppressed
CC by co-expression with selective anti-apoptotic BCl-2 proteins. The Bok
CC protein can be used to elucidate apoptosis mechanisms in reproductive and
CC other tissues, and provide a means for manipulating apoptosis. The Bok
CC protein and transgenic animal are also useful for identifying ligands or
CC substrates. Modulation of the gene activity in vivo is useful for
CC substrates. Bok genes are also useful for identification of cell type
Dased on expression. Identification of Bok as a new pro-apoptotic protein
CC with wide tissue distribution and heterodimerisation properties

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     В
                                                                                                                              Bcl-2-like polypeptides (PEPI). The NAM1 and PEPI may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Bcl-2-like polypeptides' expression. The NAM1 may be used to produce the soluble Bcl-2-like polypeptides by standard recombinant methodolgy. The polypeptides may also be used as antigens in the production of antibodies against Bcl-2 and in assays to identify modulators of Bcl-2 expression and activity. The anti-Bcl-2 antibodies and antagonists may be used to down regulate expression and activity. The anti-PEPI antibodies may also be used as diagnostic agents for detecting the presence of Bcl-2 polyps in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). Disorders that may be prevented, diagnosed
                            and/or treated by the above methods include, immunodeficiencies (e.g. a gammaglobulinemia and B cell lymphoproliferative disorder), autoimmune disorders (e.g. rheumatoid arthritis and Grave's disease), allergic reactions, inflammations, respiratory diseases and cardiovascular disorders (a full list of disorders is given in the specification). The present sequence represents a human Bcl-2-like polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ruben
                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding human Bcl-2-like polypeptides, preventing, diagnosing and/or treating - \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
                               particularly breast and ovarian cancer. The nucleic acid sequences proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's diseas allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid
                                                                                                                  isolation and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, polynucleotide and protein sequences are used in the diagnosis of cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Addison's disease; allergy; autoimmune haemolytic anaemia; autoimmune thyroiditis; diabetes mellitus; Crohn's disease; multiple sclerosis; rheumatoid arthritis; ulcerative colitis;
                                                                                                                                                                                                                                              Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB59711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the
                                                                                                                                                                                                                                                                                                                                                                      New human breast and overian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        08-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DЬ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 B
at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated proteins Tau and Big Tau, ubiquitin B, apolipoprotein E, microtubule. associated protein 2 (MAP2), neurofilament-L, neurofilament-M,
                                                                                                       multiple sclerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients,
                                                                                                                                         This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus type II
                                                                                                                                                                                                                                                                                                                         Diagnosing disease by detecting frameshift mutations in RNA corresponding protein mutations - used to diagnose cancer an neurological diseases, particularly Alzheimer's disease, and for treatment and prevention with specific ribozymes or wild
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diabetes mellitus type II; microtubule associated protein; Tau; Big Tau ubiquitin B; apolipoprotein E; MAP2; neurofilament-L; neurofilament-M; neurofilament-F; presenilin I; presenilin II; cellular tumour antigen; glial fibrillary acidic protein; GFAP; p53; semaphorin III; HUPF-1; bcl-2; B-cell leukemia/lymphoma 2.proto-oncogene; HMGP-C; NSP-A; high mobility group protein-C; neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                       Disclosure; Figure 15;
                                                                                                                                                                                                                                                                                                                                                                                                                    N-PSDB;

The present sequence is human BCL2 from which a peptide capable of inhibiting BCL2 gene, or gene product, function in cell can be derived. The cDNA sequence encoding the peptide is sense oriented genetic suppressor element (GSE) for reversing

```

The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serin residue is substituted by alanine or aspartic acid. The protein increased apoptosis inhibitory activity compared with the wild t Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatm of disorders caused by apoptosis. The present sequence is a muta

                                                                            The invention relates to an apoptosis inhibitor comprising the amino acid sequence of Bcl-2 protein in which at least one serine residue is substituted by alanine or aspartic acid. The protein has increased apoptosis inhibitory activity compared with the wild type Bcl-2 protein. The mutated Bcl-2 protein is useful in the treatment of disorders caused by apoptosis. The present sequence is a mutant

                                                           A human bcl-2 gene substantially free of introns is claimed. Also claimed is a substantially pure preparation of a protein having an N-terminal end encoded by the first exon of the human bcl-2 gene wherein said protein is bcl-2-alpha having about 239 (AAP80987) or 205 (AAP80988) AA residues. B-cell neeplasms which are associated with t(14;18) chromosome translocations cause an increase in expression of both the mRNA and the protein prods. of the bcl-2 gene. This is used to detect B-cell neeplasms including follicular lymphomas as well as other lymphomas. Bacterial isolates available as ATCC 67147 and 67148 can be used to express bcl-2 gene products alpha (AAN81292) and beta (AAN91293) resp. in bacteria.
                                                                                                                                                                                                                                             Detection of B-cell neoplasms - by extn. of proteins or RNA from B-cells and specific antibody or DNA probe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence of bcl-2-alpha encoded the 5.5 kb transcript.
